**PROUD TO BE
A MOTHER.**

It's time to enjoy the joy of Motherhood.

**Certified
Doctors**

**World Class
Treatment**

Deepam Hospital, Vazhapady was started on 31st, August 2003 with 12 bedded surgical and gynaecological centre. It was expanded into a 30 bedded Multi Speciality Hospital in 2007. The Hospital was expanded, further into an 85 bedded Super Speciality Hospital in 2011, with world class Infertility Centre as its Hallmark.

The aim of the Hospital from the day one was to serve the people with high quality health care and we succeeded in it and to-day it stands proudly with all facilities in one roof.

The Deepam Test Tube Baby Centre has a pleasant interior with self explanatory pamphlets about infertility and we do explain in detail about the procedures to the anxious infertility couples.

The motto of Deepam Hospital is world class healthcare at affordable cost and the motto of deepam test tube baby center is let motherhood blossoms

World Class Infrastructure. Advanced Treatments.

IUI

Are you considering the intrauterine insemination (IUI) procedure? The IUI procedure may help you get pregnant and take home a baby, particularly if you are dealing with infertility. Injecting the prepared sperm into your uterus is quick and virtually painless and it takes 1-2 hours at the most.

ICSI

It is often used for couples in which there are serious problems with the sperm. Sometimes it is also used for older couples or for those with failed IVF attempts. In ICSI, a single sperm is injected into a mature egg. Then the embryo is transferred to the uterus. TESA / PESA are techniques used to extract sperm from the testes and used for doing ICSI, in case of obstructive azoospermia.

Blastocyst Transfer

In a standard IVF cycle embryos are transferred to the womb two to three days after egg collection. A Blastocyst is day 5 or 6 embryo which has much more advanced structure than a 3 day old embryo and the real benefit is the potentially higher live birth rate.

Oocyte Freezing

This Oocyte cryopreservation will help you in delay childbirth and you may choose to freeze your eggs. In Certain cases, medical conditions may impair your ability to have children: endometriosis, family history of premature ovarian failure, or treatment for cancer, to name a few.

PRP

Prp(platelet Rich Plasma) used in thin Endometrium and Sexual Dysfunction.

Fertility Preserving Laparoscopy and Hysteroscopy

The Laparoscopy and Hysteroscopy is an examination to check their internal pelvic structure and gives the most important information regarding infertility also useful in correcting that leads to infertility like Myomectomy, Polypectomy, Lateral metroplasty, Ovarian cystectomy and Septal resection.

IVF

IVF (Invitro Fertilisation) is the common form of ART (Assisted Reproductive Technology). If the women's fallopian tubes are damaged or the poor ovarian reserve.

IMSI

It is a relatively new technique used to improve results in ICSI cycles, especially in repeated ICSI failures. In IMSI, Sperms are selected under high magnification (7000 times) and then ICSI is done. This will detect abnormalities in sperm head like vacuoles which are not seen on the conventional ICSI magnification. Adding IMSI to your ART treatment will help us to better our results.

Embryo Freezing

Embryos can be made frozen at any stage during the IVF process. Though most of the patients will be using their frozen embryos within three to five years after they are produced. The pregnancy rates of frozen embryos depend mainly on the age of the patient and the quality of the embryos at the time of storing them.

Frozen Embryo Transfer

It is considered to be the easiest and last step of the ART process. The intent of embryo transfer is to improve the conception following fertilisation from the ART procedure. Normally in this process the embryos are placed into the uterus of a female with an intension to establish a pregnancy.

Fertility

Have you been trying to conceive and just aren't getting pregnant? We can help. Track your three fertility cycles with our ovulation calculator and find out which foods and activities boost your fertility. Then hopefully soon, you'll need to consult our due date calculator. You are going to be a mother!!

Semen Freezing

It is the process whereby sperm cells are frozen and preserved for future use. By using a special technology and then keeping sperm in liquid nitrogen at -196 0 C, it can be stored for many years also maintaining a reasonable quality. We understand your reason for freezing for future use. We take that extra care.

Dr.A.AKILAMBAL

(Managing Director)

MBBS., DGO D.Lap., DRM., MRM., Fellowship in Cosmetic Gynecology

Dr. A. Akilambal started her practice fifteen years before, she was visibly moved by the trauma of infertility patients which made her undergo studies in Reproductive Medicine in Germany and U.K. These proved to be milestones of her career. Further a fellowship in Cosmetic Gynaecology from American Aesthetic Association added a colourful feather to her crown.

The new unit at Salem which is fully equipped to handle all gynaec cosmetology treatments with utmost care under the able stewardship of Dr.Akilambal.

Testimonial by Mrs. Kanniyamal (Patient)

“
 12 years ago, I was diagnosed with infertility. I had been trying for a long time but nothing worked. I was very sad and lost hope. Then I came to Deepam Hospital. I met Dr. Akilambal and she explained to me all the options available. I decided to go for IVF. The process was a bit scary but Dr. Akilambal and her team were very supportive and caring. After several attempts, I finally got pregnant. I am now a happy mother of a beautiful baby. I am grateful to Deepam Hospital and Dr. Akilambal for their expertise and care. I highly recommend them to anyone who is struggling with infertility.”
